

**Join us at Energy Industry Mixer – an international business meeting for
companies in the electrical energy industry**

Bosetti Global Consulting has the pleasure to invite you to participate in **Energy Industry Mixer**, a meeting for companies and institutions in the electrical energy industry based on the innovative model of “speed dating.” **On March 19, 2019, in the Conference Center of Warsaw Stadium**, manufacturers, suppliers and users of components, machines and equipment for the electrical energy industry all will have the opportunity to meet, to get know what others offer and to establish cooperative business relationships.

“We know perfectly well how important, and at the same time complicated it is to find and select partners and clients in the energy industry – that’s also why we decided to organize this meeting, whose main idea is to make it possible for companies and institutions in this sector to meet the highest possible number of potential partners in the shortest possible time. We turned to the model, innovative in business, of “speed dating,” in which representatives of companies have the opportunity to quickly present their strengths and what they offer,” explains Fabrizio Bosetti, founder of Bosetti Global Consulting, the main organiser of the meeting.

Many of the most important manufacturers of equipment and solutions for the energy industry have already announced that they will participate, as have representatives of numerous institutions that support the energy sector and directly related industries, including industry associations from Poland and abroad, institutions of higher education, chambers of commerce, research and development institutes, the media, and so on.

Moreover, with the increase in the cost of electricity expected in Poland in 2019 (from 30-70% compared to 2018), and with a view toward the further growth of these prices in the following years, part of Energy Industry Mixer will be devoted to B2B meetings between industrial companies in such areas as home appliances, automotive, or aviation and other companies specialising in the following areas: technologies supplementing or replacing traditional sources of electricity, optimization of electricity use in production processes; energy management – the purchase of “green” energy and collective purchase of energy as well as planning savings; electricity storage systems, etc.
